26 December 2024

The identification of individuals at risk of developing serious
and life-threatening conditions such as cancer remains important
in disease prevention and effective therapy.

The use of AI to develop risk engines to do this using large
datasets will be important for the Iranian population, but
also globally. Colleagues at MUMS are in the process of refining
the software for this purpose and are seeking to commercialise this.
This is an important initiative with which I am involved as a clinical
academic in the UK.

Yours sincerely,

Gordon Ferns DSc MD FRCP FRCPath
Professor of Clinical Biochemistry and Medical Education
and Deputy Dean
Brighton & Sussex Medical School
